FARM WAGE RATES UP FROM YEAR AGO
FARM EMPLOYMENT CONTINUES BELOW

HD
1525
43

Farm wage rates on about July 1 were up 6 percent from a year earlier, the Bureau of Agricultural Economics reported today. Wage rates were higher than on April 1 of this year but the increase was slightly less than usual.

There were about 11 million people working on farms during the week of June 22-28. This was about 300,000 less than a year earlier. Most of the decrease was in family workers.

All types of wage rates were up from last year by about the same percentage for the country as a whole except weekly rates without board or room which were up more than other rates. With the exception of the monthly rates in New England, all types of rates were also higher by regions. Based on the average of all rates, increases varied somewhat by regions with the larger increases in the East and West North Central and the Mountain States.

Farm wage rates for the United States on July 1 were up from April 1, which is the usual seasonal pattern. As more seasonal labor, which is usually paid at higher rates, is hired rates tend to increase. The increase this month, however, was not quite as much as is usually expected.

Per hour without board or room rates averaged \$.87 for the country as a whole. This rate averaged slightly over \$1.00 in the West North Central

and Pacific States and above \$.90 in all regions except those in the South. In the 3 southern regions, the hourly rate averages ranged from \$.54 to \$.64. Rates per day without board or room averaged \$5.20 and ranged from \$4.00 in the East South Central States to \$8.30 in the West North Central States. The high rate in the West North Central States is partly accounted for by the wage rates paid in the wheat harvest.

Farm work generally made good progress during June. Weather was favorable and permitted farmers to complete jobs on schedule. The week of June 22-28 was generally hot. Thundershowers in the latter **part of the week** brought heavy rainfall to parts of the upper Mississippi Valley and southeastward to the Middle Appalachian Region. These rains, however, had little or no effect on farm employment.

Wheat harvest was in progress during the survey week in Texas, Oklahoma, and Kansas. About 50 percent of the Kansas wheat crop was harvested during this week. Small grain harvest was also in progress in much of the South and was starting in the southern parts of the East North Central States. Cultivation and hoeing of row crops was a major operation in most parts of the country. Cotton chopping and hoeing were well along with most fields clean. Dry weather helped farmers get cotton chopping done with a minimum of labor supply problems. Corn and soybean cultivation in the Midwest also made good progress. Farmers were putting up hay in all parts of the country with very little trouble with rain.

Harvest, other than small grains, consisted mostly of fruits and vegetables. Cherries were being picked in many parts of the country. Citrus harvest in Florida was nearly over but still in progress in California. Plums, apricots and early peaches were being picked in California. Peaches were also being picked in Georgia. Potatoes, tomatoes, and melons were being harvested in many areas. Harvest of green peas for canning was in progress in some of the northern States. Farmers in the southern part of the tobacco area were cutting tobacco.

The number of people working on farms during the survey week in June was 3 percent less than a year earlier for the entire country. In the Middle Atlantic and West North Central States, a slightly larger number of people were employed on farms and in the New England and East North Central States about the same number. Decreases in total farm employment were greatest in the East and West South Central States. The decline amounted to over 200,000 in these regions. The larger decrease here is probably partly due to better progress with cultivation of the cotton crop than a year ago.

Total farm employment increased about 150,000 from a month earlier, a smaller rise than usual. Increases amounted to over 200,000 in the West North Central States and over 100,000 in the Middle Atlantic States. All regions except the South Central reported some increase but this area was down 400,000. It is usual for farm employment to decline in the East and West South Central States at this time. However, the decrease in the East South Central States was larger than usual. Increases were about seasonal except in the Middle Atlantic and the East and West North Central States where they were more than the average of recent years.

Nearly 300,000 of the decrease from a year ago in total farm employment was in family workers. In most regions, the number of family workers was slightly less than last year or about the same except in the Middle Atlantic, East South Central and West South Central States. In the Middle Atlantic States there was a slight increase while most of the decrease occurred in the South Central Region. The decrease amounted to about 240,000.

The number of family workers employed on farms usually declines about 5 percent from May to June. This year the decrease for the country as a whole was larger than usual. Most of the decrease and the largest percentage decline was in the South. By the end of June much of the work of chopping and hoeing cotton is completed and the need for labor is less than in late May. This year, with good weather, the need for cotton cultivation labor is less than usual, and in each southern region the number of family workers dropped more than usual. In the New England, Middle Atlantic, and West North Central States, there were more family workers than a month earlier, and in the Middle Atlantic States a greater than usual increase.

The number of workers hired for farm work during the survey week was 1 percent under a year ago. There were increases in the Middle Atlantic, West North Central and West South Central States where a larger wheat crop than a year ago was being harvested. In the South Atlantic, East South Central, Mountain and Pacific States there were fewer hired farm workers than last year.

There was a little more than an 800,000 increase in the number of hired farm workers from May to June. All regions, except the West South Central contributed to the increase. The number of hired workers in the West North Central States in June was more than double the number a month earlier. The increase here was considerably more than usual. The largest actual increase in numbers amounted to over 300,000 in the South Atlantic States. This increase was a little more than two-thirds but only a little greater than expected at this season. In the East North Central and Mountain States, the increase amounted to nearly a half. This was slightly greater than usual for the Mountain States but nearly twice the usual percentage in the East North Central States. The decrease in the West South Central States was less than the average of recent years.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

DEFINITIONS AND EXPLANATIONS

Employment

Farm employment estimates of the Bureau of Agricultural Economics cover persons doing farm work on all farms. Mailed questionnaires are received every month from 15,000 to 20,000 farmers who report the number of persons working on their farms. Interview surveys of farmers are used less frequently to provide bench mark data on employment. The survey week for the mailed questionnaire each month is the last complete calendar week in the month except when that week includes the last day of the month; in that case, the survey week is the next to the last full calendar week.

Employment concepts

All farm operators are counted as employed if they spend one hour or more during the survey week at farm work, chores, or in the transaction of farm business. Members of the operator's family or household doing unpaid farm work, or chores, are counted if they put in 15 hours or more during the survey week. Operators plus unpaid members of their families or households who meet these criteria of employment are called family workers. All persons doing one or more hours of farm work or chores for pay during the survey week are counted as hired workers. Members of the operator's family doing farm work for cash wages are counted as hired workers. Croppers are considered family workers when working on their own crops, but hired workers when doing farm work for pay off their own tracts. If a person is employed both as a family worker and a hired worker during the week on the same farm, he is counted as a hired worker.

Comparability with other data

The data on farm employment published by the Bureau of Agricultural Economics differ from those on agricultural employment published by the Bureau of the Census in the Monthly Report On The Labor Force. The Bureau of Agricultural Economics collects information from the employer (the farmer) who reports the number of persons working on his farm during the week, regardless of the other jobs held by those workers. The Census data, on the other hand, are obtained through interviews with approximately 25,000 farm and nonfarm households with the housewife or some other member of the household reporting on the labor force status of the household members. They relate only to persons 14 years of age and over, who are in the civilian population and not in institutions.

The difference between the Bureau of Agricultural Economics and the Census data is attributable mainly to the different treatment of three groups of workers. Children under 14 years of age who meet the criteria of employment are included in the Bureau of Agricultural Economics estimates, but not in the Census Bureau's. It is estimated that this number may reach a summer peak as high as two million. Persons working on more than one farm during the survey week are counted only once by the Census Bureau, but they are counted by the Bureau of Agricultural Economics on each farm where they work and meet the minimum hour requirements. This group is also more numerous during the harvest season when the demand for farm labor is greatest. The additional count of workers attributable to this duplication is estimated at a minimum of a quarter of a million and may be considerably larger. The third group is composed of persons who work in both agricultural and nonagricultural employment, but work longer at the nonagricultural job; they are classified by Census as working in nonagricultural employment, but by Bureau of Agricultural Economics as working on a farm. This last group may range from one-half million to a million in different seasons of the year.

Other groups counted by the Bureau of Agricultural Economics but not by the Census Bureau are imported foreign workers and some migratory workers not living in private households. On the other hand, the Census Bureau includes in its estimates of agricultural employment certain classes of workers which the Bureau of Agricultural Economics does not include. Persons with "nonfarm" occupations who are working on farms, such as bookkeepers and typists, some persons in certain agricultural processing activities, and farm operators with no other job who did no farm work are considered as employed in agriculture by the Census Bureau, but are not included by the Bureau of Agricultural Economics in its estimates of agricultural employment.

Because the volume of agricultural employment is affected by changes both in season and in weather, the difference in the week of the month for which the data are collected may also make some difference. The Bureau of Agricultural Economics data relate to the last full calendar week ending at least one day before the end of the month while the Census Bureau information relates to the week containing the 8th of the month.

The Bureau of Agricultural Economics estimates farm employment from current reports made by a selected group of farmers adjusted to enumerative survey bench mark data. The Bureau of The Census bases its figures on a sample of dwelling units. Accordingly, the figures in both cases are subject to a sampling variation and may differ from the results of a complete census.

Wages rates

Wage rates are reported quarterly by the same sample of farm operators that reports employment. The farmer is asked to report average wage rates being paid "at this time" in his locality. The "at this time" on the average probably represents the second or third day before the end of the month.

1/ Certain wage rates are not estimated for some States because they are relatively unimportant.
2/ Adjusted for seasonal variation.
